

FLOATING EXCAVATOR AND PONTOON

Fleet Engineering proudly delivers Floating Excavators and Pontoons, trusted by Japanese clients for specialized, high-standard projects. Our professional engineering team designs and develops tailored solutions to meet your unique needs, ensuring maximum performance, reliability, and value in every operation.

FLOATING EXCAVATOR

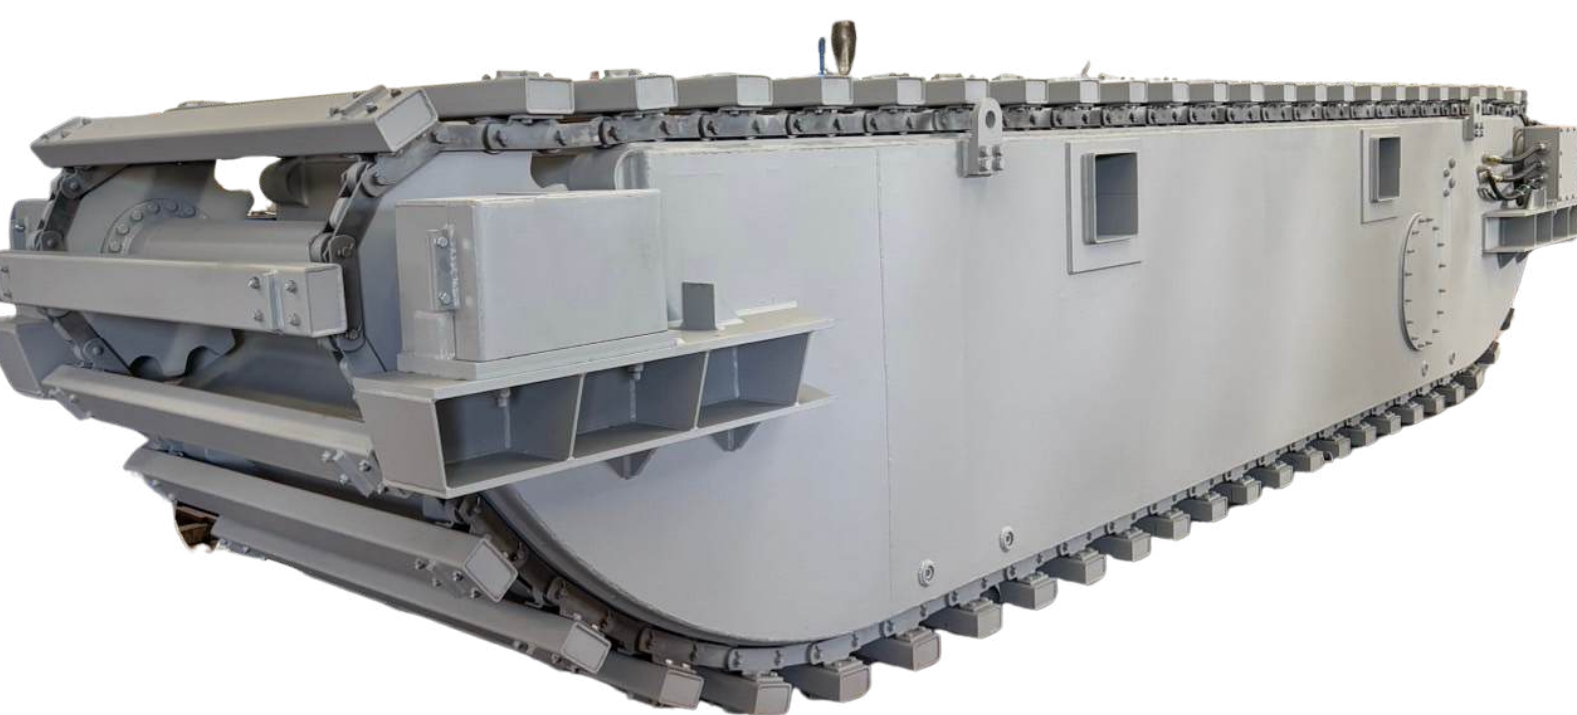

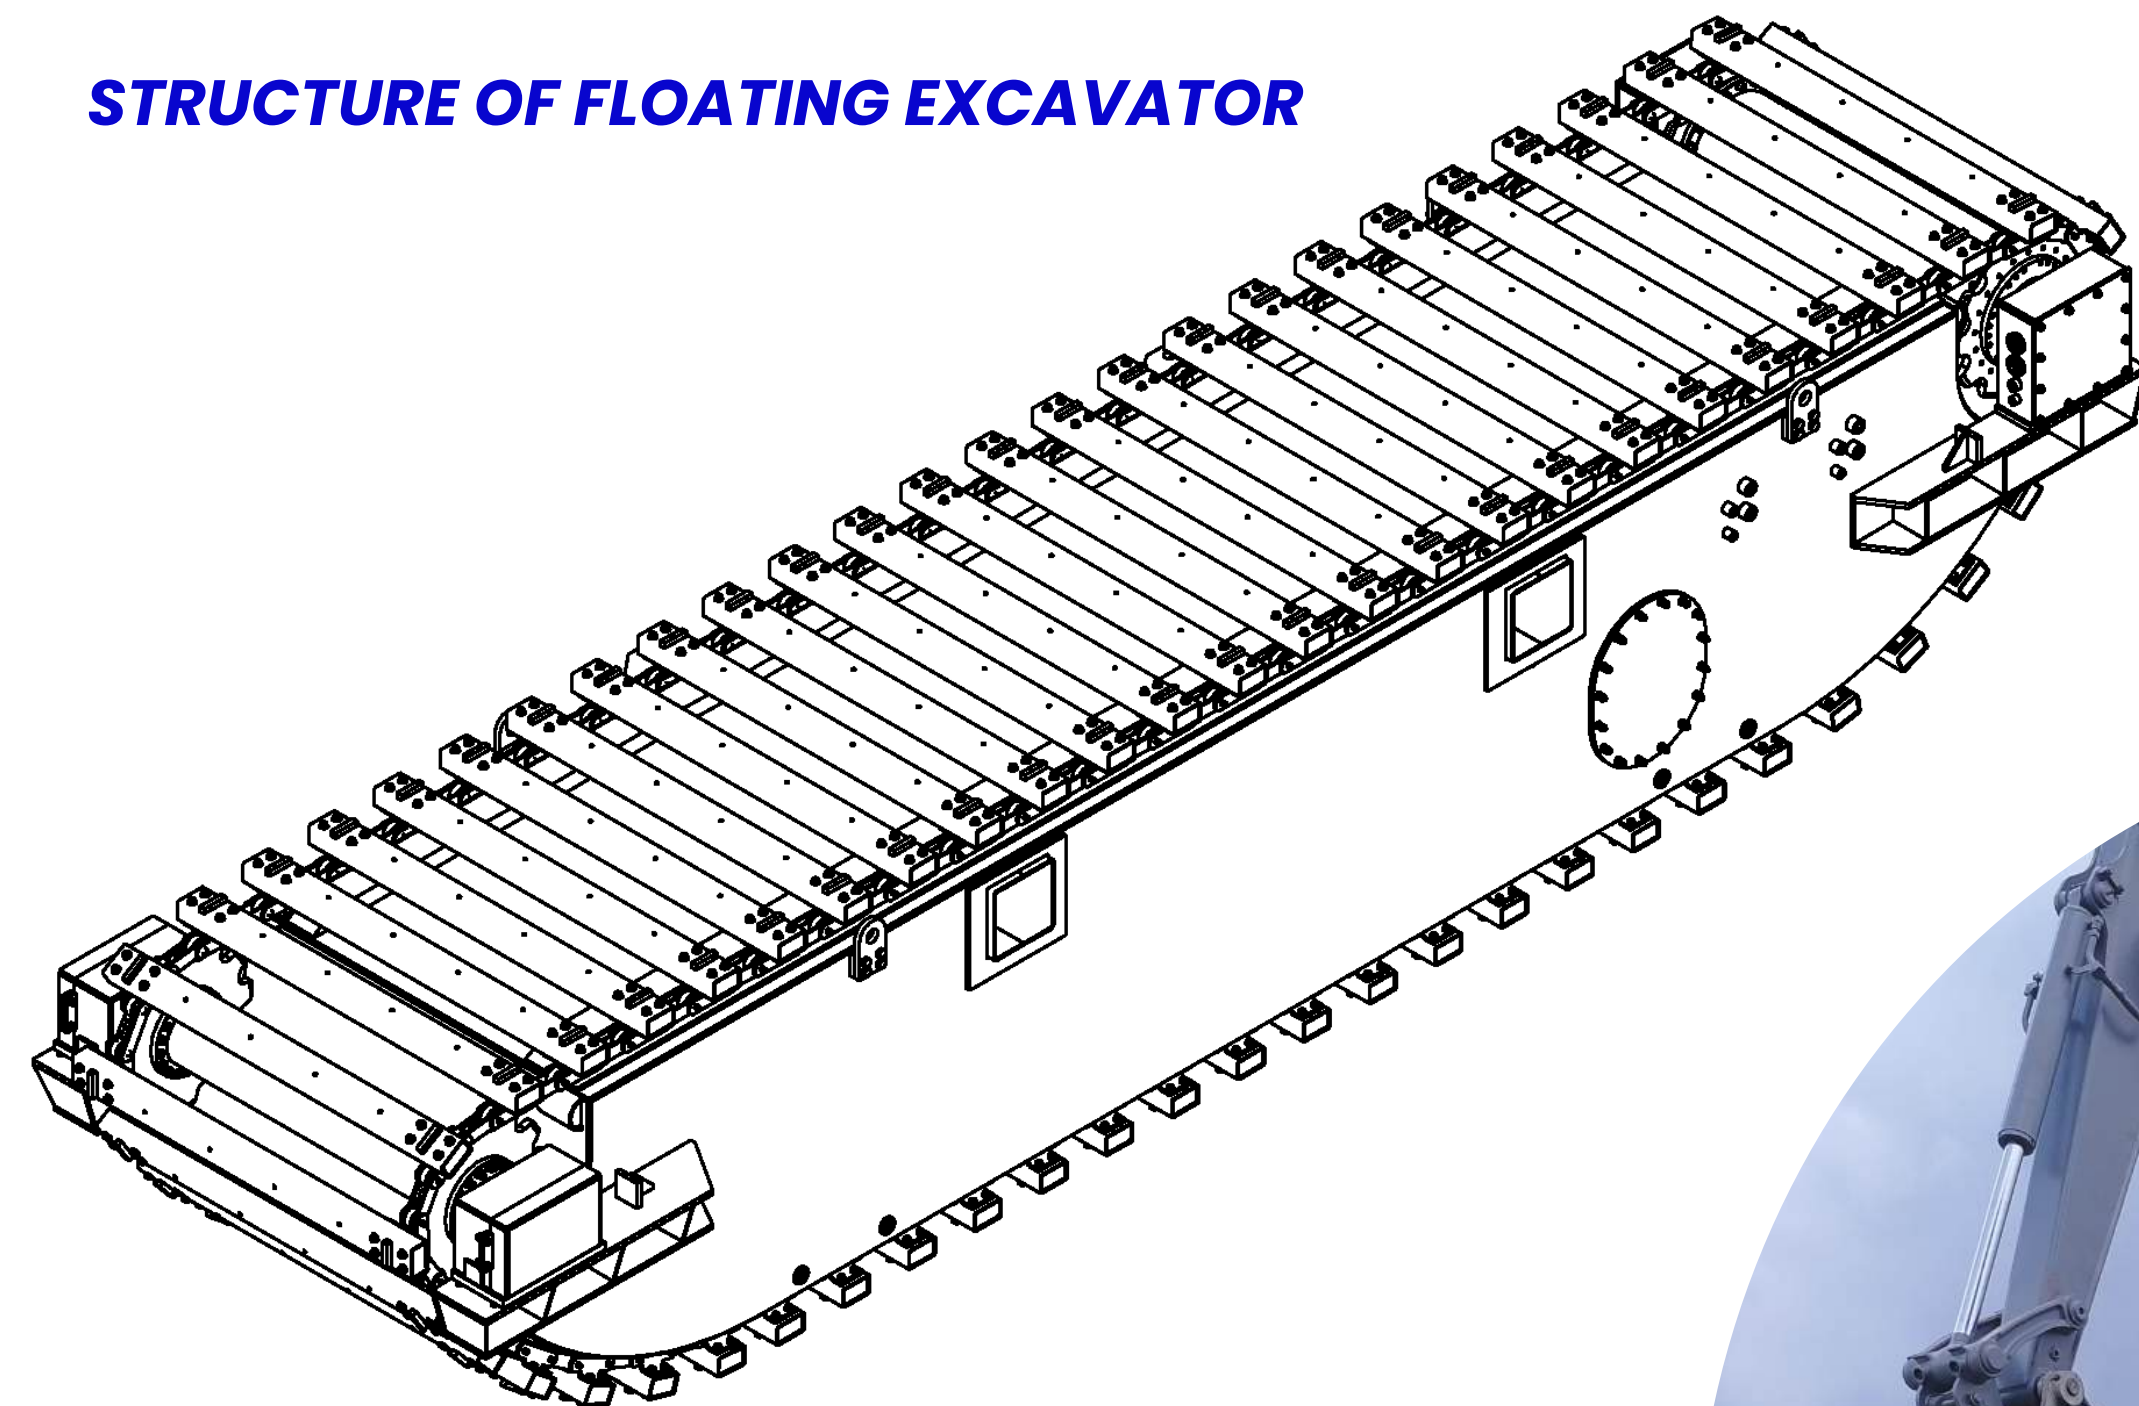

A Floating Excavator is an amphibious excavator specifically designed to operate efficiently on water. Its key feature is a floating base known as a pontoon, which allows it to work in environments.

Applications include:

- **Construction:** Dredging canals, restoring waterfront areas
- **Agriculture:** Cleaning ponds, managing water-based farming tasks
- **Maintenance:** Repairing riverbanks, operating in flood-prone or waterlogged areas

A pontoon is a floating barge or platform used as a base to support constructions or various activities on the water. It is designed to be stable and capable of bearing heavy loads. Our Pontoons are constructed from strong steel, with well-fabricated frames that enable them to float while supporting heavy machinery such as excavators. Multiple pontoons can also be connected together to form larger platforms or extended floating structures.

Applications include:

- Carrying excavators for dredging canals or performing construction works on water.
- Floating Pier / Floating Dock – allowing vessels to berth and disembark without concern for water level fluctuations.
- Pontoon Bridge – connecting multiple pontoons to create a temporary or permanent floating bridge across rivers or lakes.
- Floating Platform – serving as a base for installing machinery, equipment, or temporary workspaces on water.
